## DEPIGEI

"The painless and needle free hair removal treatment with lasting effects"

## What does it do?

It provides a long lasting, extremely effective method of hair removal.

The human hair is complex and has a three stage lifecycle called the Anagen, Catagen and Telogen phases.

During these stages the hair effectively grows, stops, dies and regenerates.

In the growing stage it is the dermic papilla that generates hair and allows it to re-grow.

It is during this initial stage of growth that by destroying the generative papilla that future growth can be prevented in most situations.

This is how electrolysis and other hair removal techniques work but Depigei is the revolutionary and virtually painless alternative.

## How does it work?

Depigei is a depilator using a tweezer which sends short waves mixed with high frequency square waves down the hair for painless, safe and progressively definitive depilation treatments.

The waves transmitted by the tweezers reach the papilla which is atrophied allowing the painless removal of the hair. There is no danger of burning nor skin irritation because with proper use the warm tweezers never touches the skin.

The results so far have proved Depigei is a fast method of depilation. By fast depilation we do not mean the speed in extracting the hair but the decreased number of depilation treatments needed to obtain good results.
